ART-UNIT: 235

PRIMARY-EXAMINER: Ellis; Richard L.

ABSTRACT:

A system for analyzing communication network events on a historical basis based on records received from the network. A data processing system is connected via a first communications co-processor to a node of the network, permitting access to the node processor event log. In response to an inquiry sent from the data processing system, the events are collected as they are reported to the node processor. A record of the events is made in a table corresponding to the particular type of event received. The records in all tables may be sorted based on dates supplied by a system operator. The sorted records comprise a report identifying particular network elements which constituted an event during the reporting period.

ATTY-AGENT-FIRM: Fulbright & Jaworski, LLP

ABSTRACT:

The subject system measures and reports the use of a personal computer by a user through a log file. The log file includes entries corresponding to predetermined

events and can report on the applications used and communication functions engaged in by the user. The log files from one or more computers may be assembled and analyzed in order to ascertain computer use habits for computer software, computer hardware and computer communications. The system may also be used to predict computer use trends and to represent computer use history.

ATTY-AGENT-FIRM: Woodcock Washburn LLP

ABSTRACT:

A method and apparatus for analyzing the performance of a data processing system, particularly a distributed data processing system, provide a system user with tools for analyzing an application running thereon. Information about the flow and performance of the application can be specified, captured, and analyzed, without modifying it or degrading its performance or data security characteristics, even if it is distributed across multiple machines. The user interface permits the system user to filter the performance information, to set triggers which the performance analyzer is able to reduce and/or combine, to observe multiple time-synchronized displays of performance data either in real time or post mortem, and to play and re-play the operation of an automatically generated application model. The invention is implemented in part by providing suitable Application Program Interfaces (APIs) in the operating system of the data processing system.

ABSTRACT:

A computer system collects, analyzes and/or transforms Internet and/or electronic commerce data of service providers. The Internet and/or electronic commerce data includes one or more of business operational data and network operational data. The mapping system includes a database storing the Internet and/or electronic commerce data for interrogation by the CSP, and at least one computer station including data transformation and database load utilities. The computer station performs one or more of the functions: of transforming and organizing the business operational data; analyzing, and organizing the web server operational data pertaining to web page requests, accesses, and browsing into the format suitable to be loaded into said database; analyzing and organizing the Internet operational data pertaining to network sessions and accesses; correlating the network sessions, and authorization and application access data to customers; creating directories of applications; translating raw system data pertaining to Internet and/or electronic commerce applications into a business context; and correlating the business operational data and the network operational data into one or more datasets.

ASSISTANT-EXAMINER: Black; Linh

ABSTRACT:

A building information system and method processes building-related data associated with a building. The building-related data, including building management system data and configuration data associated with the building, is associatively stored in a database. A building management system service manages the building subsystem and provides the building management system data stored in the database. A data interface communicates the building-related data to the database. A client interface communicates the building-related data between a client application and the data interface. Other services includes a polling service for periodically detecting point data, a metering service for periodically detecting meter data, and a rates service providing real-time price control. A client/server architecture and consistent procedural interfaces facilitate integration of additional tools and devices.
